Norwegian University of  
Science and Technology

# **TET4185: Power Markets, Resources and Environment**

## **Organization of Electricity Markets**

Hossein Farahmand  
Professor, IEL, NTNU  
Spring 2026

# Overview

- Recap-Differences between electricity and other commodities
- Different types of electricity exchange
- The time-line of electricity market in the Nordic power market

# Differences Between Electricity and Other Commodities

- Electricity is inextricably linked with a physical delivery system
  - Physical delivery system operates much faster than any market
  - Generation and load must be balanced at all times
  - Failure to balance leads to collapse of system
  - Economic consequences of collapse are enormous
  - Balance must be maintained at almost any cost
  - Physical balance cannot be left to a market

Balance between electricity generation and electricity consumption

Source: <https://www.next-kraftwerke.com/knowledge/afrr>

2021 Texas power crisis- At least 210 people lost their lives during the winter storm

# Differences Between Electricity and Other Commodities

- Electricity generation is pooled
  - Electricity transferred through the grid is not physically labelled
  - Generators cannot choose their consumers and vice versa\*
  - Electrical energy produced by all generators is indistinguishable
- Pooling is economically desirable
- A breakdown of the system affects everybody

Source: <https://www.bkk.no/om-bkk/bli-kjent-med-stromnettet>

Source: <https://www.aither.com/renewable-energy/guarantee-of-origin/>

# Differences Between Electricity and Other Commodities

- Electricity demand has predictable variation
  - Daily, weekly, seasonal variations
  - Similar to other commodities (e.g. coffee)
- Electricity cannot be stored
  - Must be consumed when produced
- Production must be able to deliver peak demand
  - The instantaneous power demand
- Short-term elasticity (change) of demand is very low
  - Demand curve is almost vertical

Retail sales of electricity by end-use sector  
billion kilowatthours

# Electricity Market

- A market is an environment to help buyers and sellers interact and agree on transactions
- Market equilibrium: the price clears the market, that is, the supply is equal to demand
- Large consumers and retailers purchase electrical energy from generating companies based on their forecasted consumption

# Different types of markets

- **Capacity [MW]:** Sufficient power production in the grid. System operators trade this to ensure sufficient generation capacity is present for reliable system operation in future years and at competitive prices
- **Energy [MWh]:** a central place for the optimal scheduling and settlement of energy exchanges
- **Ancillary service [ $\Delta MW$ ]:** any type of service that supports power system operations, directly bought by the system operator, e.g.
  - Primary reserves (change within seconds)
  - Secondary reserves (change within minutes)
  - Tertiary reserves (slow change within minutes)
  - Black-start capability, short-circuit power, reactive reserves and voltage control

# Different types of electricity exchange

- **Centralised trading (Auctions in an electricity pool)**
  - Every producer and consumer places offers and bids into a pool
  - No one knows about the others prior to clearing
  - Centralized market-clearing algorithm decides about bids and offers that are retained
  - Market is cleared, a price is found, specific offers/bids accepted
- **Bilateral trading (agreement between traders)**
  - This trading is for a direct exchange of power between a buyer and a seller
  - Does not use a pool-trading scheme, trades directly between each other
  - They may both be producers and /or consumers
  - Most likely, a broker is involved ...

# Centralised Trading

- All producers submit offers to the market operator
- All consumers submit bids to the market operator
- Market operator determines successful bids and offers and the Market Clearing Price
- In many electricity markets, the demand side is passive. A forecast of demand is used instead.

# Example of centralised trading

Offers and bids in the Electricity Pool of Syldavia for the period from 9:00 till 10:00 on 11 June:

|        | Company | Quantity [MWh] | Price [\$/MWh] |
|--------|---------|----------------|----------------|
| Offers | Red     | 200            | 12.00          |
|        | Red     | 50             | 15.00          |
|        | Red     | 50             | 20.00          |
|        | Green   | 150            | 16.00          |
|        | Green   | 50             | 17.00          |
|        | Blue    | 100            | 13.00          |
|        | Blue    | 50             | 18.00          |
| Bids   | Brown   | 50             | 13.00          |
|        | Brown   | 100            | 23.00          |
|        | Purple  | 50             | 11.00          |
|        | Purple  | 150            | 22.00          |
|        | Orange  | 50             | 10.0           |
|        | Orange  | 200            | 25.00          |

# Example of centralised trading

# Example of centralised trading

- Market clearing price: 16.00 \$/MWh
- Volume traded: 450 MWh

| Company | Production<br>[MWh] | Consumption<br>[MWh] | Revenue<br>[\$] | Expense<br>[\$] |
|---------|---------------------|----------------------|-----------------|-----------------|
| Red     | 250                 |                      | 4000            |                 |
| Blue    | 100                 |                      | 1600            |                 |
| Green   | 100                 |                      | 1600            |                 |
| Orange  |                     | 200                  |                 | 3200            |
| Brown   |                     | 100                  |                 | 1600            |
| Purple  |                     | 150                  |                 | 2400            |
| Total   | <b>450</b>          | <b>450</b>           | <b>7200</b>     | <b>7200</b>     |

# Reasons for not treating each market period separately

- Why do we only consider 1 market time unit (MTU) of operation per market round?
- Should we treat these markets separately when bidding?
- Things to consider:
  - Operating constraints on generating units
    - How long can we operate/keep offline continuously? (down/up times)
    - How quickly can we change production? (ramping rates)
  - Saving achieved through scheduling
    - Cost of start-up and no-load operation
  - Reduce risk for generators
    - Uncertainty on the generation schedule leads to higher prices → unit commitment

Source: <https://www.energy.gov/eere/articles/confronting-duck-curve-how-address-over-generation-solar-energy>

# Power Pool or Power Exchange

## Power Pool – US

- A central scheduling and dispatch
- Unit Commitment and Economic Dispatch
- Objective: Optimisation resources

## Power Exchange- Nordpool

- It does not include an explicit optimisation
- The market participants are self-dispatch: determine themselves how to generate or consume depending on volumes and price
- Objective: Perfectly competitive market

# Approaches to representing network constraints

- There are basically two philosophies, developed on both sides of the Atlantic:
  - US
  - Europe

|                 | Europe                    | US           |
|-----------------|---------------------------|--------------|
| System Operator | TSO                       | ISO          |
| Market Operator | Ind. Market Operator      | ISO          |
| Clearing        | Supply-demand equilibrium | UCED problem |
| Prices          | Zonal                     | Nodal        |

TSO: Transmission System Operator

ISO: Independent System Operator

UCED: Unit Commitment and Economic Dispatch

# Bilateral trading-forward market

- Bilateral trading is the classical form of trading
- Involves only two parties:
  - Seller
  - Buyer
- Trading is a private arrangement between these parties
- Occasionally facilitated by brokers or electronic market operator
- Price and quantity negotiated directly between these parties- no “official” price

**Pay-As-Bid**

# Types of bilateral trading depending on time scale

- Customized long-term contracts
- “Over the Counter” OTC trading
- Electronic trading

# Customized long-term contracts

- Flexible terms
- Negotiated between the parties
- Duration of several months to several years
- Advantage:
  - Guarantees a fixed price over a long period
- Disadvantages:
  - Cost of negotiations is high
- Worthwhile only for large amounts of energy

# OTC-“Over the Counter” trading

- Smaller amounts of energy
- Delivery according to standardized profiles
- Advantage:
  - Much lower transaction cost
- Used to refine position as delivery time approaches

# Electronic trading (already leaning towards the pool concept)

- Buyers and sellers enter bids directly into computerized marketplace
- All participants can observe the prices and quantities offered, but participants remain anonymous
- Automatic matching of bids and offers
- Market operator handles the settlement
- Advantages:
  - Very fast and cheap
  - Very good source of information about the market

# Example of bilateral trading

Generating units owned by Borduria Power:

| Unit | $P^{\min}$ [MW] | $P^{\max}$ [MW] | MC [\$/MWh] |
|------|-----------------|-----------------|-------------|
| A    | 100             | 500             | 10.0        |
| B    | 10              | 200             | 13.0        |
| C    | 0               | 50              | 17.0        |

# Example of bilateral trading

Trades of Borduria Power for 11 June from 2:00 pm till 3:00 pm

| Type      | Contract Date | Identifier | Buyer             | Seller         | Amount [MWh] | Price [\$/MWh] |
|-----------|---------------|------------|-------------------|----------------|--------------|----------------|
| Long term | 10 January    | LT1        | Cheapo Energy     | Borduria Power | 200          | 12.5           |
| Long term | 7 February    | LT2        | Borduria Steel    | Borduria Power | 250          | 12.8           |
| Future    | 3 March       | FT1        | Quality Electrons | Borduria Power | 100          | 14.0           |
| Future    | 7 April       | FT2        | Borduria Power    | Perfect Power  | 30           | 13.5           |
| Future    | 10 May        | FT3        | Cheapo Energy     | Borduria Power | 50           | 13.8           |

Net position: Sold 570 MW  
 Production capacity: 750 MW

| Unit | $p_{\min}$ [MW] | $p_{\max}$ [MW] | MC [\$/MWh] |
|------|-----------------|-----------------|-------------|
| A    | 100             | 500             | 10.0        |
| B    | 10              | 200             | 13.0        |
| C    | 0               | 50              | 17.0        |

# Example of bilateral trading

## *(Electronic Trade)*

Pending offers and bids on Borduria Power Exchange at mid-morning on 11 June for the period from 2:00 till 3:00 pm:

| 11 June 14:00-15:00   | Identifier | Amount [MW] | Price [\$/MWh] |
|-----------------------|------------|-------------|----------------|
| Offers to sell energy | B5         | 20          | 17.50          |
|                       | B4         | 25          | 16.30          |
|                       | B3         | 20          | 14.40          |
|                       | B2         | 10          | 13.90          |
|                       | B1         | 25          | 13.70          |
| Bids to buy energy    | O1         | 20          | 13.50          |
|                       | O2         | 30          | 13.30          |
|                       | O3         | 10          | 13.25          |
|                       | O4         | 30          | 12.80          |
|                       | O5         | 50          | 12.55          |

# Example of bilateral trading

Electronic trades made by Borduria Power:

| 11 June 14:00-15:00   | Identifier | Amount [MW] | Price [\$/MWh] |
|-----------------------|------------|-------------|----------------|
| Offers to sell energy | B5         | 20          | 17.50          |
|                       | B4         | 25          | 16.30          |
|                       | B3         | 20          | 14.40          |
|                       | B2         | 10          | 13.90          |
|                       | B1         | 25          | 13.70          |
| Bids to buy energy    | O1         | 20          | 13.50          |
|                       | O2         | 30          | 13.30          |
|                       | O3         | 10          | 13.25          |
|                       | O4         | 30          | 12.80          |
|                       | O5         | 50          | 12.55          |

Net position: Sold 630 MW

Self schedule: Unit A: 500 MW

Unit B: 130 MW

Unit C: 0 MW

# Example of bilateral trading

Unexpected problem: unit B can only generate 80 MW

- Options:
- Do nothing and pay the balancing price for the missing energy
  - Make up the deficit with unit C
  - Trade on the available power exchange

| 11 June 14:00-15:00   | Identifier | Amount [MW] | Price [\$/MWh] |
|-----------------------|------------|-------------|----------------|
| Offers to sell energy | B5         | 20          | 17.50          |
|                       | B4         | 25          | 16.30          |
|                       | B3         | 20          | 14.40          |
|                       | B6         | 20          | 14.30          |
|                       | B8         | 10          | 14.10          |
| Bids to buy energy    | O4         | 30          | 12.80          |
|                       | O6         | 25          | 12.70          |
|                       | O5         | 50          | 12.55          |

Buying is cheaper than producing with C

New net position: Sold 580 MW

New schedule: A: 500 MW, B: 80 MW, C: 0 MW

# The time-line of electricity market in the Nordic power market

# Day-ahead (Elspot)

- A day-ahead market is a financial market!
  - These are only transactions - No one is “forced” to generate or consume...
  - Both market participants and system operator are informed about market clearing
  - outcomes (price and volumes for each market time unit)
  - In the European set-up, the market participants will then self-dispatch, i.e., determine themselves how they will generate or consume depending on volumes and prices
- The day-ahead market is cleared a reasonably long time before actual operations (between 12 and 36 hours)
- Remember there is a network involved, and power has to flow...

# From day-ahead market to actual operation

- Alternative ways for the scheduled supply and demand to minimize imbalances:
  - Compensate with other generation/consumption means within their own portfolio
    - Re-dispatch of own units
  - Find ways to adjust through agreements with other players between the day-ahead market clearing and actual operations
    - Intra-day (/adjustment) market
  - Let the system operator put the system back to balance
    - Balancing market

# Intra-day market (European Cross-Border Intraday (XBID))

- While the day-ahead market is
  - a centralised trading
  - based on an auction mechanism
- The intraday market is based on bilateral contracts, even though centrally organized.
- Trading closes 60 minutes before delivery in most Nordic areas
- Some reasons for that:
  - less players,
  - less liquidity,
  - the need for corrective actions may highly vary depending upon how new information disclosure occurs between day-ahead market clearing and actual operations (XBID uses a single shared order book, a continuous trading system, and a common IT platform)...
  - Unlike day-ahead auctions, orders are matched continuously
- In Norway, XBID is operated through Nord Pool, with the Norwegian TSO Statnett providing grid capacity to the system.

# Balancing Market (frequency)

- Balancing market-single buyer
  - Provides a quick way of bridging the gap between supply and demand
  - Balancing market is used for adjustments of imbalances from day-ahead market clearing
  - **Balancing market is the market of last resort – A real-time market**
- System operators (TSO) manage this for each area (country-level, region etc.)
  - Maintain security-of-supply
- Efficient balancing markets ensure the security of supply at a cost-reflective balancing prices

Kraftbalansen i Norge

Kraftsystemet er i balanse

Kraftbalansen i Norge

Kraftsystemet er i balanse

# Balancing market

# Example of Balancing market

## Borduria Power's position

| Unit | $P^{\text{sched}}$ | $P^{\text{min}}$ | $P^{\text{max}}$ | MC       |
|------|--------------------|------------------|------------------|----------|
|      | [MW]               | [MW]             | [MW]             | [\$/MWh] |
| A    | 500                | 100              | 500              | 10.0     |
| B    | 80                 | 10               | 80               | 13.0     |
| C    | 0                  | 0                | 50               | 17.0     |

- 11 June between 2:00 pm and 3:00 pm
- Balancing price: 18.25 \$/MWh and Borduria is participating in balancing market using unit C.
- Unit B of Borduria Power could produce only 10 MWh instead of 80 MWh
- Borduria Power thus had a deficit of 70 MWh for this hour
- 40 MW of Borduria Power's balancing market bid was called by the system operator

# Settlement Process

The process of getting money from people who bought energy to the people who have produced it

- Day-ahead market (Centralised trading)
  - Market operator collects from consumer
  - Market operator pays producers
  - All energy traded at the Market Clearing Price (MCP)
- Intraday Market (Bilateral trading)
  - Bilateral trades settled directly by the parties as if they had been performed exactly
- Balancing Market (All imbalances in a given settlement period are priced at the same balancing price → single pricing)
  - If system is in short position
    - Produced more or consumed less → received balancing price
    - Produced less or consumed more → pay balancing price

# Borduria Power's Settlement (ex post)

| Market                  | Type      | Amount<br>[MWh] | Price<br>[\$/MWh] | Revenues<br>[\$] | Expenses<br>[\$] |
|-------------------------|-----------|-----------------|-------------------|------------------|------------------|
| Futures and<br>Forwards | Sale      | 200             | 12.50             | 2,500.00         |                  |
|                         | Sale      | 250             | 12.80             | 3,200.00         |                  |
|                         | Sale      | 100             | 14.00             | 1,400.00         |                  |
